

ABSTRACT

A method for providing telecommunications users access to information networks. This is achieved by providing access information for at least one service provider to a 5 service application. Thereafter, the service application retrieves the access information when information is requested from the service provider. The service application formats a request with the access information and transmits the request to the service provider. The 10 service provider's response is presented to the user. By the use of this invention, the user can request information from a service provider from one or more devices without re-entering the access information.
